

# Challenging Anti-fragile Blockchain systems

Miguel González  
Univ. Lille 1

# What is Anti-fragile?

Harmed by  
disorder

Resilient to  
disorder

Benefits and Learns  
from disorder

# Systems considered anti-fragile

- Financial system
- Human Body
- Restaurant system
- Healthcare system
- Netflix as a company and its architecture
- **Bitcoin**

# Industries are interested in Bitcoin

- Banks
  - Music
  - Retail
  - Supply Chain
  - Manufacturing
- 
- But they see **issues** with the Bitcoin protocol, so they are investing in **Blockchain**

# What is a Blockchain ?

- **A chain (sequence) of blocks of transactions**
  - Each block consists of a number of transactions

- **A Blockchain is just a Distributed Database with:**
  - Added security
  - Consensus
  - Data immutability
  - Smart Contracts (chaincode)
  - Authorization & Authentication
  - Record keeping

# Traditional vs. Blockchain

|                                   | Proof of Work (Bitcoin, Ethereum)  | State machine replication (Hyperledger, Corda)   |
|-----------------------------------|--|--|
| <b>Membership</b>                 | Permissionless   | Permissioned   |
| <b>User IDs</b>                   | Decentralized, Anonymous<br>(Decentralized protection by PoW compute/hash power) | Centralized, all<br>Nodes know all other Nodes<br>(Centralized IDM protects against Sybil attacks) |
| <b>Scalability (no. of Nodes)</b> | Excellent, >100k Nodes   | Verified up to few tens (or so) Nodes  |
| <b>Throughput</b>                 | 7 tx /sec upper bound (Bitcoin)  | >10k tx /sec with existing implementations in software   |
| <b>Power efficiency</b>           | >1 GW (Bitcoin)  | Good (commodity hardware)  |
| <b>Forks in blockchain</b>        | Possible (leads to double spending attacks)                                      | Not possible   |
| <b>Consensus</b>                  | No   | Yes, with BFT protocols  |
| <b>Cryptocurrency</b>             | Yes  | No   |
| <b>Anti-Fragile</b>               | Yes  | ???  |

# Problem

- Important institutions are rushing to implement Blockchain.
- Most implementations are untested and will likely have bugs.
- Hypothesis: Removing key elements from anti-fragile system like Bitcoin will make it more fragile
- What can I use to test Distributed Systems like Blockchains?
  - Formal methods
  - **Failure injection**
  - Instrumentation

# Related Work

- Random fault injection (Basiri et al., 2016)
- Byzantine fault injection (Martins et al., 2013)
- Lineage-driven fault injection (Alvaro et al., 2015)

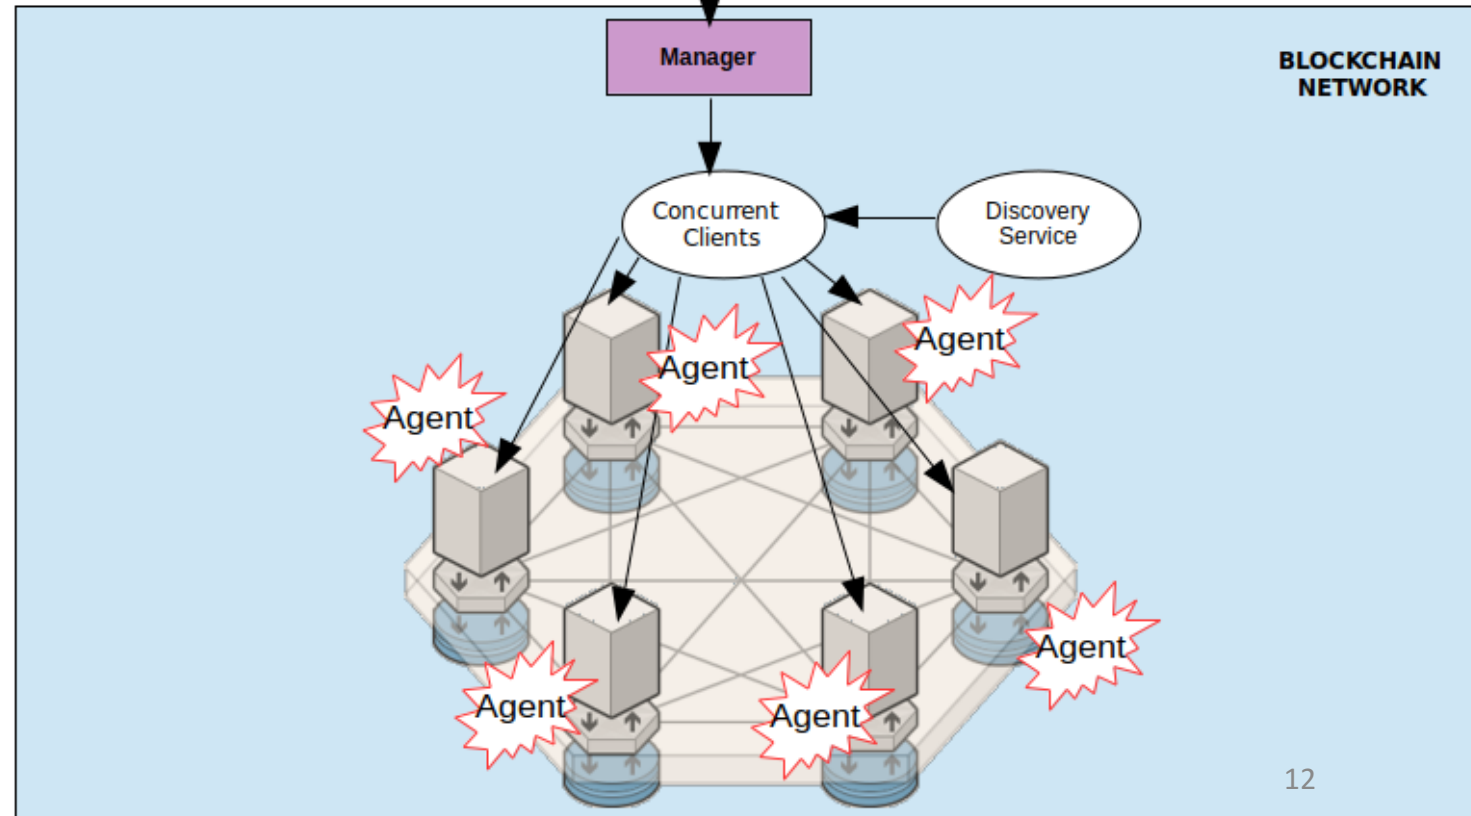

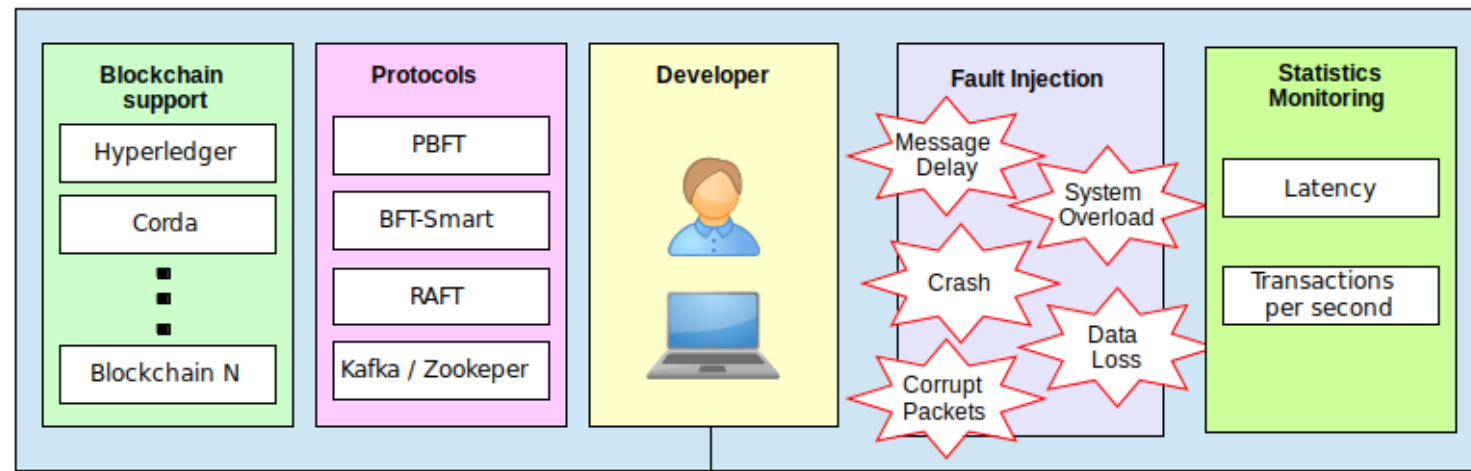

# Motivation

- Blockchain technologies do not have any **fault injection frameworks**
- Blockchain tech hasn't **been formally verified**
- Available fault-injection solutions **do not cover Byzantine** failures

# My proposal

- **Systematic Byzantine Failure Injection** for Blockchain technology.
- Byzantine faults in consideration
  - Crash
  - Message Delay
  - Corrupt Packets
  - System Overloading
- Systematic and recoverable injection
  - Fault Type
  - Fault Parameters (fault duration, delay time, # clients)
- Blockchain and protocols in consideration
  - Hyperledger Fabric - PBFT & Kafka
  - Corda - BFT-Smart & RAFT

# Architecture for Failure Injection

# Challenge

- Create a general solution to inject Byzantine failures into Blockchains despite their differences:
  - Language
  - Architecture
  - Protocol

# Next Steps

- Complete implementation of the Failure injector
- Perform large scale experiments with Hyperledger Fabric and Corda
- Introduce Smart failure injection like LDFI
- Start the base line for a Benchmark for permissioned Blockchain

# END

- Problem: Recent interest in Blockchain technologies that remain untested. They lack good testing framework to verify and compare them. We don't know if they are anti-fragile.
- Contribution: **Systematic Byzantine Failure Injection** for Blockchain technology. Aims to help benchmark Blockchain technologies and endow them with anti-fragility if used in production.

# Example of Failure

- http POST <http://injector:8080> cmd="WAIT" period=500 type="DELAY"
- http POST <http://injector:8080> cmd="START" type="DELETE" path="/var/lib/hyperledger/data"
- http POST <http://injector:8080> cmd="WAIT" type="DOWN" iface="eth0"
